Why Big Data?

UNDERSTANDING THE VALUE OF BIG DATA MEASUREMENT

Viewer behavior has fragmented, with people moving to streaming at an unprecedented rate. As a result, consumers are no longer limited to a wired cable box and are largely watching live TV content on Smart TVs or with internet connected over-the-top devices.

Panel-only measurement is no longer sufficient, especially for narrowly-defined audiences.

Most importantly, it fails to represent multicultural audiences, **undercounting and undervaluing Hispanics by upwards of 20%** - even for broad demographics.

BIG DATA BENEFITS

UNLOCKING VIEWERSHIP'S TRUE SCALE

Audience Planning

- Converged TV planning
- Stronger data matches & TelevisaUnivision Household Graph activation

Audience Measurement

- Granular measurement
- De-duplicated reach & frequency across platforms

Impact & outcomes

- Grow/maintain reach while limiting excessive frequency
- Superior deterministic attribution
- Improved Roas

Big Data: Reach & Frequency

Long-Tail

SMALLER NETS MEASUREMENT

Gain granular views across smaller, long-tail networks.

Deeper program/audience measurement available with big data helps you determine the full extent of media buys.

GalaNovelas **monthly reach across adults ages 18-49 doubles** while the average frequency drops 4% when measured with big data.

RF Management

ORGANIC REACH INCREASE

Increase Reach while reducing excessive over-frequency.

UniMas sees **reach increase 38%** for A25-54 while frequency reduces by 25%

Univision sees a **30% reach increase** while frequency immaterially changes by 2%.

The Challenge

WORKING WITH BIG DATA ID'S IN A PII COMPLIANT MANNER

Identity-Restrictions

Reach & Frequency planning requires access to unique viewership data, which has become increasingly restricted.

- The inclusion of STB data in measurement sources has introduced limitations on individual viewing access (75 ID minimum).
- Necessitated the use of data clean rooms and new processes for measurement data access.
- Size/Scale of big data leads to lengthy ID-forecast times + compute costs.

Reach & Frequency Clustering Methodology

datafuelX Approach to ID-level forecasting in respect to PII compliance and data clean rooms

Sample Set

Using a sample set of HH's on specific network(s), generate a matrix of historical viewing and demo vectors.

Cluster Creation

With the historical viewing and demo vectors, create clusters of like-behavior/characteristics.

Assign HH's

Scale to full set by assigning *ALL* HH's in viewership set to clusters.

Audience Proportions

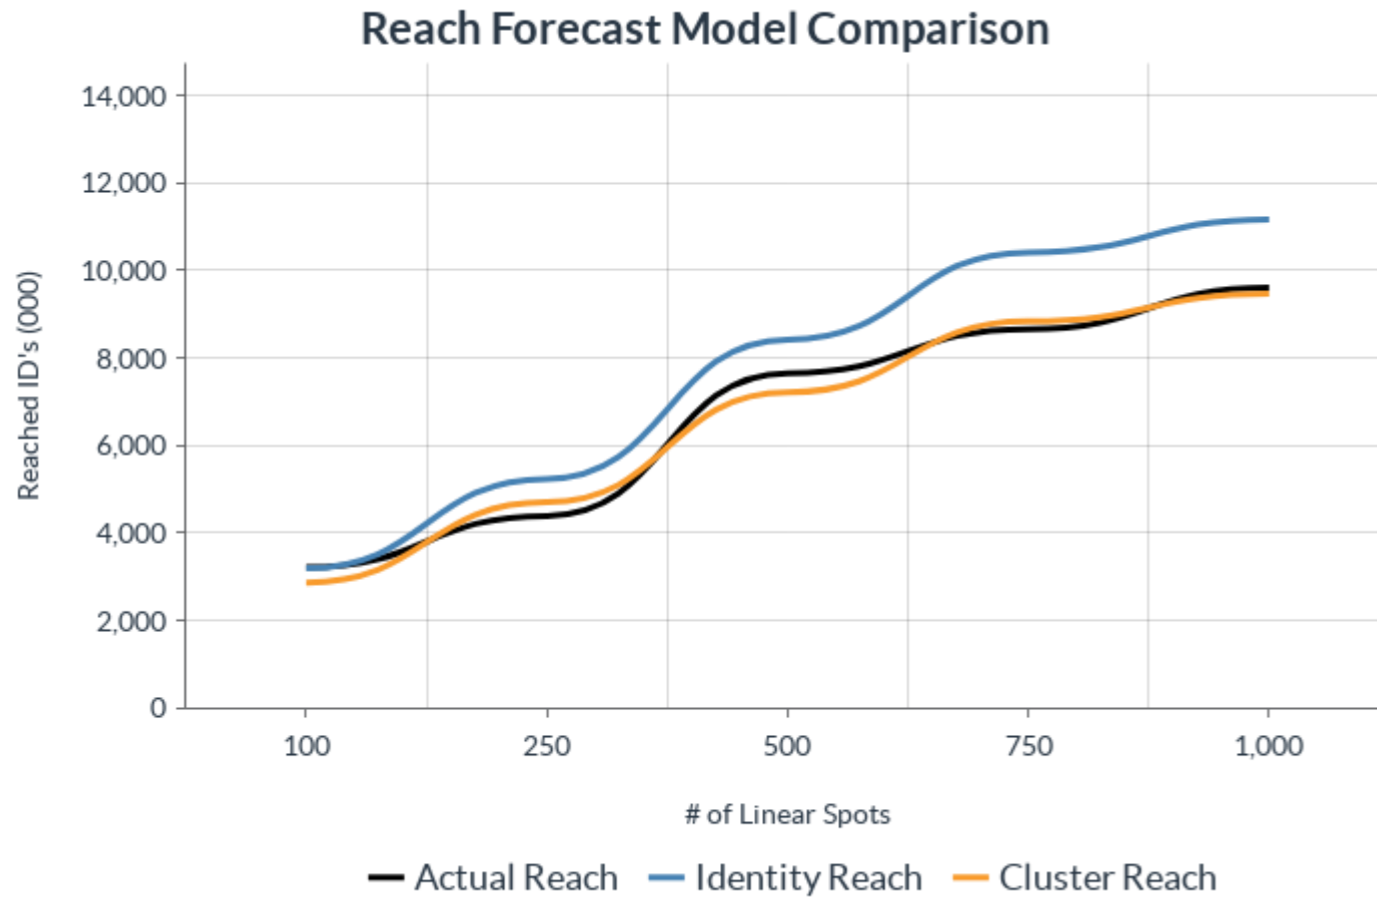

Generate composition statistics that describe what proportion of each cluster are members of the various demographic groups & strategic targets that are to be measured.

Forecast

Predict cluster viewership behaviors across networks, forecasting content consumption levels in the future.

Evaluating Cluster Reach Forecast Accuracy

VALUE OF CLUSTERING FOR REACH FORECASTS AT SCALE

100+ Spots Error Rate:

Identity

Forecasts show up to 20% error rate on scaled Reach Forecasts.

Cluster

Forecasts show up to 7% error rate on scaled Reach Forecasts.

Cluster Compute Value

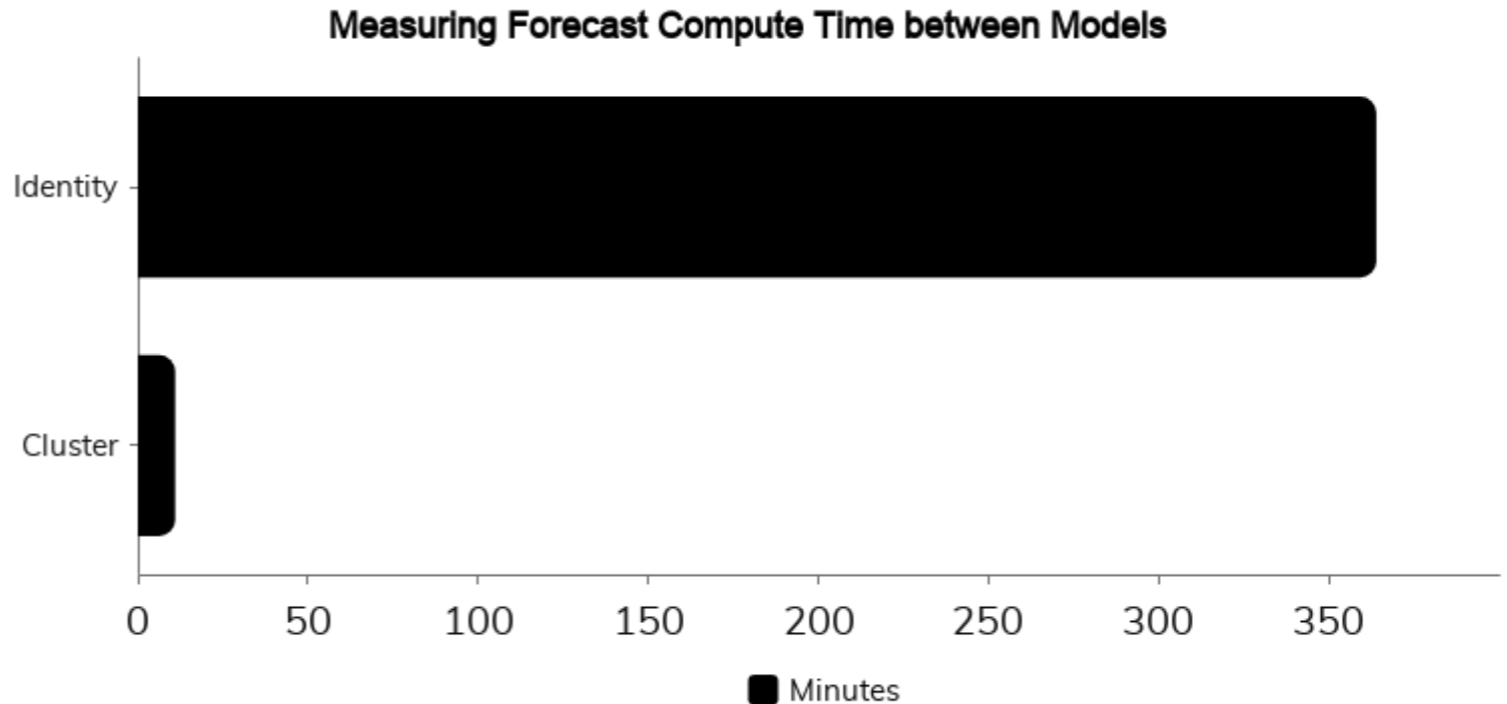

500+ hrs annually

When scaled to multi-measurement sources, multiple networks

- ✓ CLUSTERS BUILT MONTHLY
- ✓ DATA REFRESHED WEEKLY
- ✓ FORECAST WEEKLY

Compute Time

Comparing the time difference in forecasting identities versus Clusters for one network.

Clustering Value

FROM HYPOTHESIS TO OUTCOMES

PII-Compliant

Preserving the use of Identity-level planning in an increasingly PII-concerned ecosystem.

Efficiency & Accuracy

Delivering comparable accuracy metrics with strong improvements in compute cost & time.

Cross-Platform RF

By scaling cluster assignments to digital ID's, can empower Cross-platform RF management & optimization.
